Why choose Colour coated mulch?

Rubber mulch is a cost effective, and coloured, recycled product. It blends colour coated recycled SBR tyre shred with a flexible, moisture curing polyurethane binder.

However, at CONICA, we also use colour coated recycled SBR tyre granule to create a pre-blended granule/shred mix that provides outstanding strength and an easier to finish, more consistent surface than can be created when using mulch compromising of just shred.

CONICA rubber mulch is often used for playground projects where a low cost solution is required that still meets stringent critical fall height requirements (to EN1177). It is typically installed in a single layer which enables very fast and low cost installation. However, larger areas can be completed even more cost effectively using a base layer of SBR rubber, followed by a top layer of 20mm of rubber mulch.

The benefits of choosing colour coated mulch are:

- ✓ Low cost material that can be installed quickly
- ✓ Excellent water permeability
- ✓ Subtle colours and carefully selected particle size/shape
- ✓ Insitu refurbishment option available
- ✓ EN1177 HIC certified
